

Consulting Solutions

SGP is proud to include a variety of businesses within the financial services industry in our client base. From large international banks to small local businesses, SGP professionals provide individualized solutions to a variety of business needs. SGP solutions combine technical expertise with business sense.

Real Estate

Real Estate Deal System

The Real Estate Deal System was created for the internal management of real estate portfolios. Deals are tracked from approval through expiration. Multifaceted reminder systems and on demand reporting allow you to manage your portfolio in a fluid environment. Risk Assets, loan to value ratios, margin statistics, derivative products, and market pricing trends are just a few details that can be easily obtained by the click of a mouse. The portfolio can be viewed on a servicing subsidiary, section or branch level as well as by project type, product type, and geographic location. Standard reports include Watchlist reports, Fed reports and Past Due reports. All reports can be run historically to easily comply with auditing requests. A custom query builder provides reporting flexibility. Due to the modular approach of the system, additional functionality can be added to track Construction Activity, Tenant Risk Analysis, Property/Casualty and Terrorist Insurance Coverage/Shortfall or any other area of concern.

Sensitivity Analysis System

Sensitivity Analysis System is a powerful management tool that enables you to view how different scenarios will affect your portfolio. Users can identify existing deals as well as new candidate deals to be included in any scenario. Sensitivity reports indicate compliance with quantitative measures on an individual deal, sub portfolio and general portfolio level.

Banking

Profitability System

The Profitability System tracks monthly income, expenses and volume data by department and corporate entity. Data is consolidated from multiple sources in mainframe systems. Profitability reports may be generated by department or by entity.

Budget Collection

The Budget Collection system is a distributed system allowing each department to submit Expense, Revenue and Risk Asset budget numbers to management. Department heads can enter budget numbers individually or as a percentage of last year's values. Current YTD and forecast values are displayed. Once the budget is completed, it is submitted to management electronically for consolidation.

Insurance

Emergency Claims Management System

The Emergency Claims Management System allows for the entry of all claims for a regional emergency. Users can enter existing or forecasted claims. The system applies all applicable treaties to each claim to calculate actual dollar loss and tracks both insurance payouts and reinsurer payments. Reports can be generated for each policy or reinsurer by date range.

Work Tracking System

The Work Tracking System is a benchmark system tracking the amount of time needed to execute a policy from initial contact through closing. Performance is tracked for each regional office and consolidated for reporting on a national level.

Theatrical

Lincoln Center House Seats System

Lincoln Center Theater fills approximately 10,000 house seat requests per year. The House Seats System enables assignment and tracking of house seats for all events arranged by the Lincoln Center Theater. It is a full-scale seat requisition & approval system, with built-in reporting capabilities. In accordance with box office standards and administrative requirements, the House Seats System allows Lincoln Center Theater to better manage and track its use of house seats.

Clark Transfer Sales and Dispatch System

SGP International developed a customized Sales and Dispatch System for Clark Transfer to track all stages of a show's move from initial bidding to driver payment vouchers. The new system provided links to the company's accounting software and other third party software systems used in the trucking industry. After implementing the Sales and Dispatch System, the ability to find specific units and keep accurate track of company resources was vastly enhanced, and preventive maintenance occurred more regularly.
